#1) What is the average total bill amount?

```
average_total_bill = df['total_bill'].mean()
print("Average total bill amount:", average_total_bill)
```

Average total bill amount: 19.78594262295082

#2) How many customers are smokers?

```
smoker_count = df[df['smoker'] == 'Yes'].shape[0]
print("Number of smokers:", smoker_count)
```

Number of smokers: 93

#3)What is the highest tip amount?

```
highest_tip = df['tip'].max()
print("Highest tip amount:", highest_tip)
```

Highest tip amount: 10.0

#4)What is the percentage of male and female customers?

```
gender_percentage = df['sex'].value_counts(normalize=True) * 100
print("Percentage of male and female customers:")
print(gender_percentage)
```

```
Percentage of male and female customers:
Male      64.344262
Female    35.655738
Name: sex, dtype: float64
```

```
#5)What is the average tip amount for each day of the week?
average_tip_per_day = df.groupby('day')['tip'].mean()
print("Average tip amount per day:")
print(average_tip_per_day)
```

```
Average tip amount per day:
day
Fri      2.734737
Sat      2.993103
Sun      3.255132
Thur     2.771452
Name: tip, dtype: float64
```

```
#6)What is the average total bill amount for dinner and lunch?
average_bill_per_time = df.groupby('time')['total_bill'].mean()
print("Average total bill amount per time:")
print(average_bill_per_time)
```

```
Average total bill amount per time:
time
Dinner    20.797159
Lunch     17.168676
Name: total_bill, dtype: float64
```

```
#7)What is the total number of records in the dataset?
total_records = len(df)
print("Total number of records:", total_records)
```

```
Total number of records: 244
```

```
#8)What is the average tip percentage (tip amount as a percentage of the total bill) for each record?
df['tip_percentage'] = (df['tip'] / df['total_bill']) * 100
average_tip_percentage = df['tip_percentage'].mean()
print("Average tip percentage:", average_tip_percentage)
```

Average tip percentage: 16.08025817225047

#9)How many customers are males and how many are females?

```
gender_counts = df['sex'].value_counts()
print("Number of males and females:")
print(gender_counts)
```

```
Number of males and females:
Male      157
Female     87
Name: sex, dtype: int64
```

#10)What is the total amount spent on dinners and lunches separately?

```
total_spent_per_time = df.groupby('time')['total_bill'].sum()
print("Total amount spent per time:")
print(total_spent_per_time)
```

```
Total amount spent per time:
time
Dinner    3660.30
Lunch     1167.47
Name: total_bill, dtype: float64
```

#11)What is the highest total bill amount for smokers and non-smokers?

```
highest_total_bill_smokers = df[df['smoker'] == 'Yes']['total_bill'].max()
highest_total_bill_non_smokers = df[df['smoker'] == 'No']['total_bill'].max()
print("Highest total bill amount for smokers:", highest_total_bill_smokers)
print("Highest total bill amount for non-smokers:", highest_total_bill_non_smokers)
```

```
Highest total bill amount for smokers: 50.81
Highest total bill amount for non-smokers: 48.33
```

#12)What is the average tip amount for male and female customers?

```
average_tip_per_gender = df.groupby('sex')['tip'].mean()
print("Average tip amount per gender:")
print(average_tip_per_gender)
```

Average tip amount per gender:

sex

Female 2.833448

Male 3.089618

Name: tip, dtype: float64

#13)What is the highest tip amount given on Sundays?

```
highest_tip_sunday = df[df['day'] == 'Sun']['tip'].max()
```

```
print("Highest tip amount on Sundays:", highest_tip_sunday)
```

Highest tip amount on Sundays: 6.5

#14)What is the average total bill amount for parties of different sizes?

```
average_bill_per_size = df.groupby('size')['total_bill'].mean()
```

```
print("Average total bill amount per group size:")
```

```
print(average_bill_per_size)
```

Average total bill amount per group size:

size

1 7.242500

2 16.448013

3 23.277632

4 28.613514

5 30.068000

6 34.830000

Name: total_bill, dtype: float64

#15)How does the total bill amount vary with party size?

```
import matplotlib.pyplot as plt
```

```
plt.scatter(df['size'], df['total_bill'])
```

```
plt.xlabel('Party Size')
```

```
plt.ylabel('Total Bill Amount')
```

```
plt.title('Variation of Total Bill Amount with Party Size')
```

```
plt.show()
```

#16)How does the average tip percentage vary based on the day of the week?

```
import numpy as np
```

```
average_tip_percentage_per_day = df.groupby('day')['tip_percentage'].mean()
```

```
plt.bar(average_tip_percentage_per_day.index, average_tip_percentage_per_day.values)
```

```
plt.xlabel('Day of the Week')
```

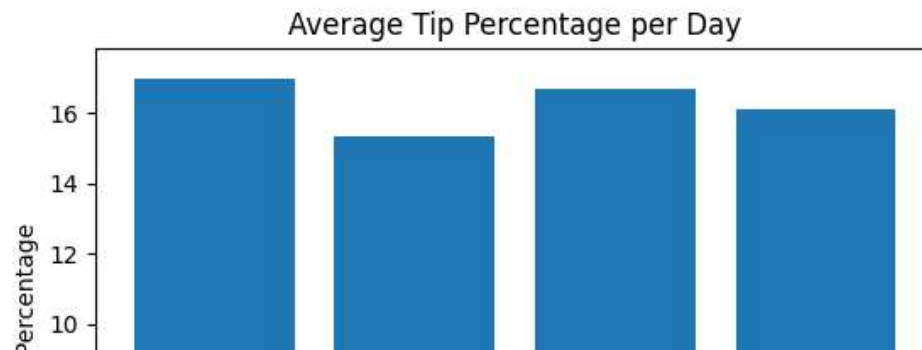

```
plt.ylabel('Average Tip Percentage')
```

```
plt.title('Average Tip Percentage per Day')
```

```
plt.xticks(np.arange(len(average_tip_percentage_per_day)), average_tip_percentage_per_day.index)
```

```
plt.show()
```

Object `week` not found.

#17)What is the gender distribution of customers in the dataset?

```
gender_counts = df['sex'].value_counts()
```

```
plt.pie(gender_counts, labels=gender_counts.index, autopct='%1.1f%%')
```

```
plt.title('Gender Distribution of Customers')
```

```
plt.show()
```

Gender Distribution of Customers

#18)What is the distribution of tip amounts?

```
import seaborn as sns
```

```
sns.histplot(df['tip'], kde=True)
plt.xlabel('Tip Amount')
plt.ylabel('Frequency')
plt.title('Distribution of Tip Amounts')
plt.show()
```

#19)How does the total bill amount differ between smokers and non-smokers?
import seaborn as sns

```
sns.boxplot(x='smoker', y='total_bill', data=df)
plt.xlabel('Smoker')
plt.ylabel('Total Bill Amount')
plt.title('Comparison of Total Bill Amount between Smokers and Non-Smokers')
plt.show()
```

Comparison of Total Bill Amount between Smokers and Non-Smokers

#20) What is the relationship between the total bill amount and the tip amount?

#Can we predict the tip amount based on the total bill using linear regression?

```
from sklearn.linear_model import LinearRegression
```

```
X = df[['total_bill']]
```

```
y = df['tip']
```

```
model = LinearRegression()
```

```
model.fit(X, y)
```

```
slope = model.coef_[0]
```

```
intercept = model.intercept_
```

```
new_total_bill = 30.0
```

```
predicted_tip = model.predict([[new_total_bill]])
```

```
plt.scatter(X, y)
```

```
plt.plot(X, model.predict(X), color='red', linewidth=2)
```

```
plt.xlabel('Total Bill Amount')
```

```
plt.ylabel('Tip Amount')
```

```
plt.title('Linear Regression: Total Bill vs Tip Amount')
```

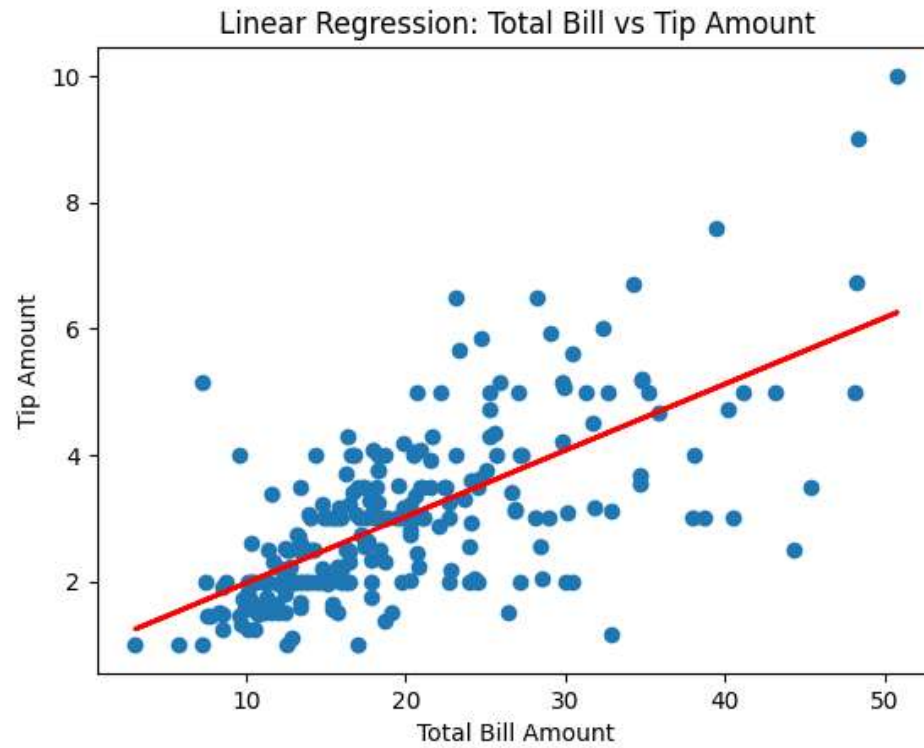

```
plt.show()
```

```
print("Slope:", slope)
```

```
print("Intercept:", intercept)
```

```
print("Predicted tip amount for total bill $30.0:", predicted_tip)
```

```
/usr/local/lib/python3.10/dist-packages/sklearn/base.py:439: UserWarning: X does not have valid feature names, but LinearRe  
warnings.warn(
```

Slope: 0.10502451738435337

Intercept: 0.9202696135546731

Predicted tip amount for total bill \$30.0: [4.07100514]
